

Meeting 11/3:

Last week:

- Read through papers;
 - o Genomics data would be very interesting area to apply to, naturally compositional in nature (as is microbiome data). Geological/economics applications as well.
 - o Correspondence analysis textbook, looking into technical details of that
 - o Literature review notes: see GitHub

This week:

- Continue with Literature Review (How much technical detail should I go into? Currently mostly higher-level understanding, I assume when we have a more precise idea of what I'm doing technical details will be learnt then?)
- Implement algorithms (CoDA-PCA to begin with?)
- Gather datasets
- Ideally find area to focus on... still unsure where open work would be
